

DSA 210 PROJECT PROPOSAL

Bora Yilmaz 35827

I will analyze my personal gameplay data from *League of Legends* to understand the factors affecting my ranked performance.

The data will be collected using the Riot Games Developer API. I will retrieve my match history and profile data using my Riot account. Each observation will correspond to one match. The dataset will include variables such as match outcome (win/loss), kills, deaths, assists (KDA), champion played, role (lane), game duration, damage dealt, and vision score.

I expect to collect approximately 50–200 match records depending on API limits.
